is back for 1995 and faster than ever. When racing on the World Cup circuit, second best won't cut it. To succeed here means you're the best

in the sport. And that's something at GT we don't take lightly. • The USA made Team RTS (Rocker Tuned Suspension™) 6061-T6 aluminum frame incorporates race car suspension technology to provide the proper amount of chassis stiffness to constrain wheel movement, to give the Team RTS the advantage of full suspension with rigid frame acceleration. The suspension configuration of the RTS offers three distinct

advantages: Anti-squat, Anti-dive, and Adjustability. * The Anti-squat geometry allows the chain force to counteract the rearward weight transfer due to

forward acceleration. It ensures the suspension stays topped out during normal riding, thus preventing energy loss, with no "bobbing". So when you're sprinting for the finish or climbing a technical section, you have optimum power transfer to the rear wheel. . During braking, weight transfer tries to compress the front, as well as extend the rear suspension. By incorporating Anti-dive geometry, the forces generated by braking actually compress the rear suspension,

LEGHOLL S

weight transfer to the front, thereby improving braking performance. * With the idea that no rider was created equal, the RTS system is designed for complete adjustability. The RTS can easily be tuned to fit each riders individual riding style, weight, and handling preferences. The USA made Noleen oil dampened coil over shock's adjustable compression damping and spring preload allows the shock to be tuned for a variety of terrain. . The Team RTS. Race tested, and proven.

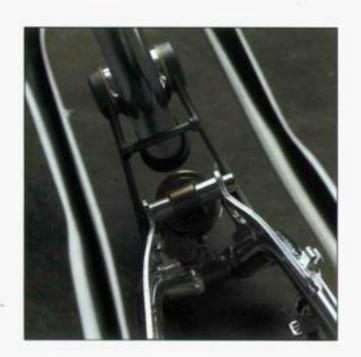

* frame shown with optional RockShow suspension fork

Fresh out of the gate, and already posting podium finishes, the Team LTS is the new

force to reckoned with on the professional race circuit. . Crafted in the USA from 6061-T6 aluminum, the Team LTS employs a classic "four-bar linkage" suspension system. This unique design centers around imaginary points called

"instantaneous centers of rotation". These points, located at the intersection of the chainstay and upper link (approximately 20 feet in front of the bike), are where the acceleration forces are trans-

mitted into the suspended chassis. As the rear axle moves up and down, its instantaneous center of rotation moves in the opposite

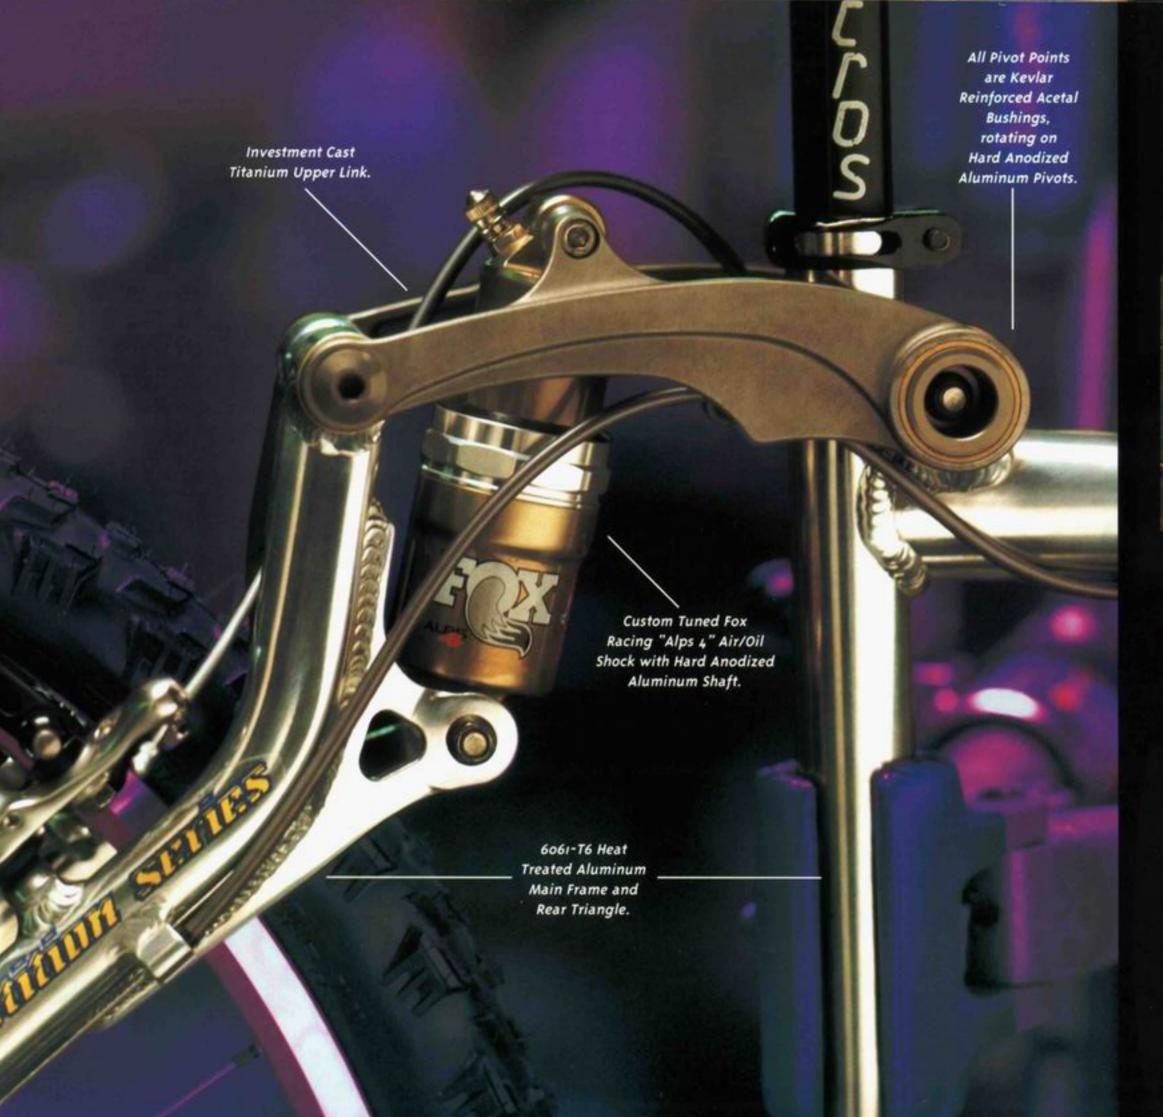

the world of active suspension to a new level of performance.

direction. The end result virtually eliminates any pedaling influence when compressing deep into the suspension travel. * In chain driven vehicles, Anti-squat geometry allows the chain tension to counteract the rearward weight transfer. With the Team LTS' four bar linkage suspension design, we have achieved optimum Anti-squat (100%). With 100% Anti-squat, the weight transfer to the rear wheel

is perfectly balanced by the driving force pushing the rear axle downward, therefore creating a lifting force at the rear of the bicycle. This balancing force

is what eliminates "bio-pacing", and allows the LTS to have significant droop travel. * By allowing the rider to set up the bicycle with the proper amount of "droop", the Team LTS' rear wheel travels with the terrain giving the rider superior traction and braking control. * Featuring a USA made Fox Racing air/oil adjustable shock, investment cast titanium upper link, "kneeaction" style shock activation, and ball burnished finish the Team LTS takes

have fallen prey to the Xizang as it powered home such champions as Juli Furtado, Gerhard Zadrobilek and Chantal Daucourt.

Angle for angle, tube for tube, and spec for spec, this is the exact bike raced by Team GT pros on the World Cup circuit. And when you total up their respective wins, you can only imagine what this USA made thoroughbred could do for your performance. Making a bike worthy of such great riders takes the finest talent, materials and ingenuity. And at GT, we let nothing

ratio (almost twice that of steel), its workability and optimum cold-worked-stress-relieved yield strength.

When utilizing titanium in bicycle construction the selection of alloys is paramount. Through years of research and testing, the titanium found to be best suited for bicycle construction is 3/2.5 titanium. 3/2.5 is a titanium alloy consisting of 3 parts aluminum and 2.5 parts vanadium.

Tubes cut and mitered, the highly skilled welders that titanium requires take charge. Due to some of its unique characteristics, titanium must be welded in an environment completely free of oxygen and contaminants. To accomplish this the welding area is surrounded with an inert gas, which in turn keeps oxygen away and eliminates any possibility of weld contamination. Once the frame is complete a hand polishing process is applied that achieves a unique shine exclusive

to natural titanium. * When all the designing, tube selection, welding and testing are done, the finished frame represents a benchmark of modern ideals and technology. To see a Xizang is to see a bike that has taken some of the world's top athletes to the podium. To ride a

Xizang, well, that's an experience we'll leave for you to find out.

Trials/Extreme rider Hans Rey. And if you've ever seen Hans ride, you can appreciate what that means. For over 4 years Hans has been

blazing some of the toughest and most extreme trails in the world. And year after year it's the same story, the Zaskar LE handles whatever Hans throws its

way. * To make the Zaskar LE capable of enhancing a rider like Hans' performance we pulled out all the stops. Featuring our race proven Triple Triangle Design™ frame, the Zaskar LE is created using 6061-T6 heat treated aluminum to create a light-weight, yet strong and powerful frame. With the equipment abuse that goes hand in hand with competing on the World Cup circuit, special attention was paid to the very critical high stress areas, such as the seatstays, chainstays and juncture of the

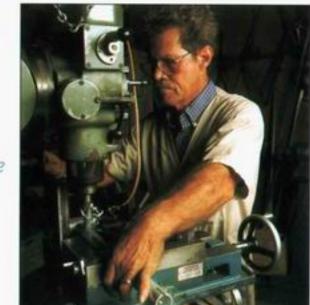

process the frame is tumbled in a large drum filled with thousands of ball bearings. This constant bombard-

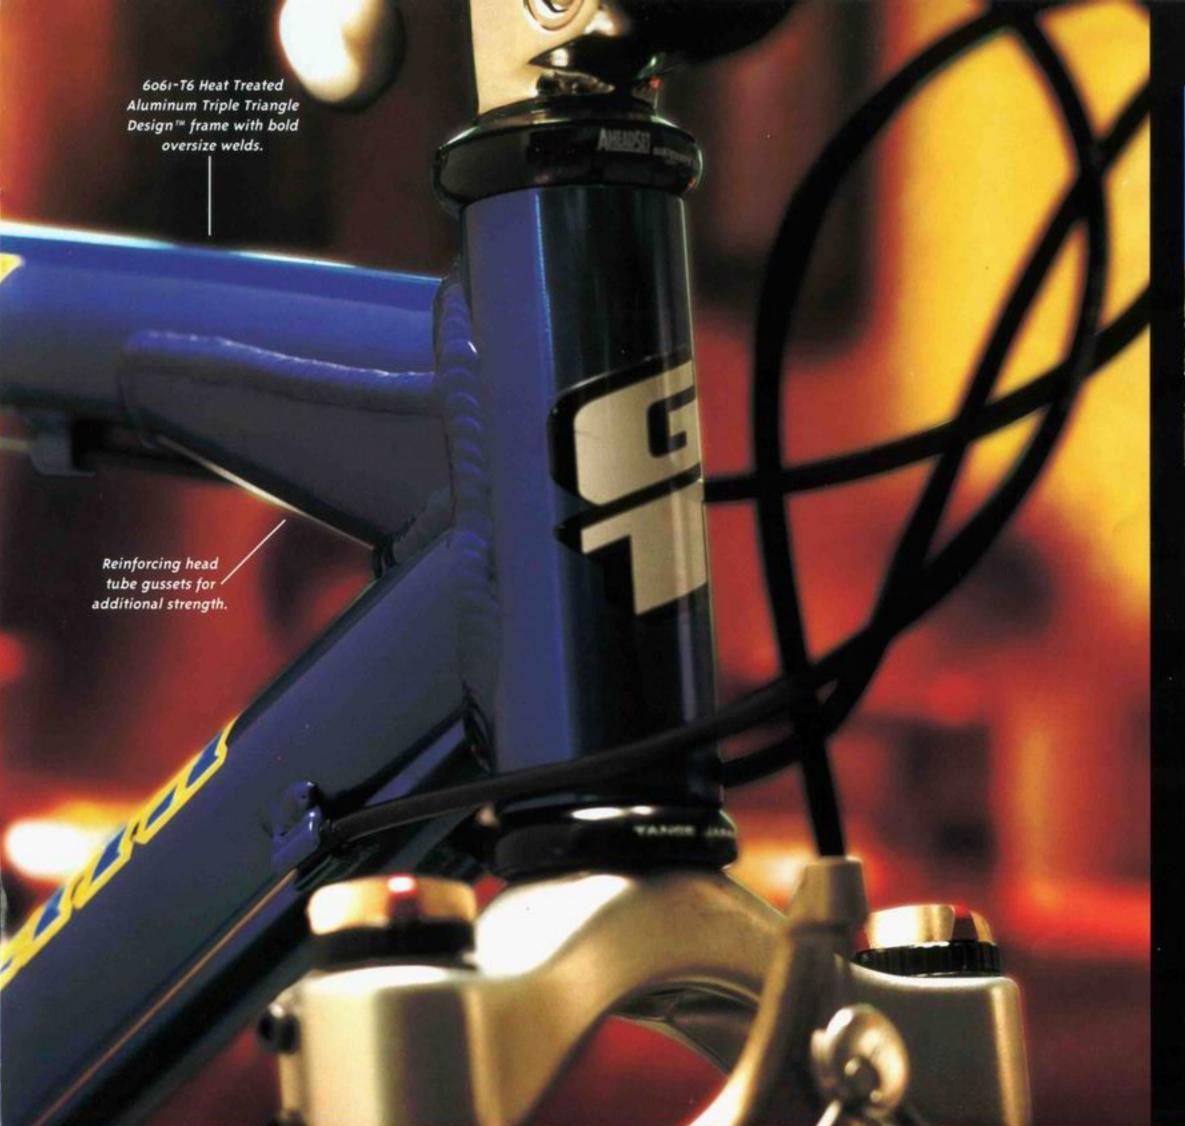

head, top, and down tubes. To strengthen these areas we used oversized butted tubing and bold welds. At the head tube we also added powerful reinforcing gussets to aid in the distribution of stress loads over a larger surface area. * And as if that were not enough, even the finishing process adds to the strength, as well as the beauty, of the Zaskar LE. Every Zaskar, including anodized frames, undergoes a unique process called "ball burnishing". In this

ment of ball bearings acts as a mild form of "shot-peening" that not only polishes the frame, but compresses and strengthens the aluminum as well. From the extreme to the World Cup circuit, the Zaskar LE is ready to win. The Zaskar LE is available in Ball

Burnish, Anodized Turquoise, Ink Blue or Purple Fade.
